

For example 1: If the initial queue with size=5 is empty and do with the following instructions : enqueue(5), enqueue(10), dequeue(), enqueue(15), dequeue()., what value will remain on the queue?

Answer: [?]

For example 2: If the exist queue with size=5 contains the numbers [20, 30, 40] , and do with the following instructions : dequeue(), enqueue(50), dequeue(), enqueue(60). , what value will remain on the queue?

Answer:

For example 3: if there is no queue's instance variable before, write statements in main program to create the instance variable myqueue with size=5. Then enqueue the number 1, 2, 3, 4, 5 in that order, and dequeue 3 times by using class Queue's methods that we learned. Finally write the element that remain on the queue's instance variable myqueue.

Is Different from

For example 3.1: if there is **the exist** queue's instance variable **myqueue** with size=5 contains the numbers [10, 20, 30, 40] ...
